

Scope Statement Aid for Scope Baseline Engine App

The document presents a comprehensive analytical framework for defining project scope, deliverables, requirements, and success criteria for the purpose of generating the scope statement, WBS and WBS dictionary that form the scope baseline using the Scope Baseline Engine application. It establishes the project’s scope and objectives by outlining high-level goals, product details, and service descriptions, along with the key deliverables, features, and benefits associated with each component. Requirements for products, services, and results are detailed with an emphasis on the features and benefits they must provide. The framework also specifies deliverables and process-completion expectations, describing objectives, constraints, readiness criteria, and definitions of done for products, services, capabilities, and ancillary results. Phase-level completion requirements are included, incorporating projected dates, resources, and quality checkpoints. The document further identifies the assumptions and constraints that influence project execution, defines acceptance criteria, limitations, and exclusions, and clarifies scope boundaries by distinguishing what is in scope and out of scope. Finally, it highlights the perceived business benefits and explains how they add value, while summarizing the overall scope and clearly stating what the project will and will not include.

After completing the fields in this document, summarize the scope statement, major deliverables, exclusions, assumptions, constraints and final acceptance fields in the Scope Baseline Engine tool. The tool will generate a Scope Baseline. Please note that the engine is for one time use. If you alter any source inputs, you should copy and paste the input into another application, re-run the tool, and paste the input back in for a different result.

To run the app: move the scope-baseline-engine folder to your device. Double click on the file named index.html to run the program.
